## Description

The RVSE UI has to have for Discovery Wizard AD Browser at least User with Domain Administrator rights to successfully browse the Domain, or parts of Domain if there are Child Domains or Forest Domains.

There is one "NOTE:Make sure that the current user has read permissions for the Active Directory." at the end of Discovery Wizard - Discovering New Devices - Active Directory chapter. Technically it is OK, but at wrong place and to general.

**Note:**
Make sure that the current user has read permissions for the Active Directory.

Documentation could be changed with Note like that ()

at:

Discovery Wizard - Discovering New Devices - Active Directory (under LDAP browser "be awere:")

with additional text about "at least User with Domain Administrator rights":

or move "Note:" at root of (many of sub chapters also need AD rights):

Discovery Wizard - Discovering New Devices - Active Directory
